

Parafloat

Prevents parachutes from sinking after landing on water

The Parafloat is a small and handy unit that attaches to the parachute harness. When in contact with water, an inside bladder inflates to keep the parachute afloat for at least 15 minutes – sufficient for a safe pick up.

The unit can be attached to the harness with carabiners or other suitable fasteners.

Technical data

Part Number:	2-110
Weight:	0,6 kg
Length:	230 mm
CO ₂ cartridge:	33 grams
Buoyancy:	150 kg / 330 lbs
Inspection interval:	Yearly
Colour:	Orange

The Parafloat unit is small and handy
